Construction

- FTTH Network construction will be all underground, construction will be completed using several methods such as horizontal direction drilling.

Construction

- Individual drop connections that will connect homes to the network will be installed using a plow that simply makes a small slit along the ground and inserts the cable.

Construction

- All areas of work will be restored by our landscaping contractor to their original state once work has been completed.
- Several underground vaults will be installed and will be left in the ground after construction is completed. These vaults contain connection points for homes to connect to the network.

Construction

- Locates are a critical part of the underground construction and ensure safety of both existing utilities and our construction crews.
- Paint will wash off with rain it is not permanent.
- At points where our duct structure will be crossing over or under existing utilities we expose the existing utility so that we can visually inspect as we pass over or under to ensure no damage is caused to the existing service.

Project Overview

- The project will take approximately 3 months to complete.
- There will be no charge to the home owner to have our service installed.
- We need 50 interested home owners in order to move the project forward, we are not asking for anyone to sign-up at this time just that they would sign up if the service was available.
- Assuming enough interest we would enter into an easement agreement with Killam to allow us to place our fibre optic cable.

Thank You
